

Obada Erfan

Solutions Architect · Full-Stack Developer

obadaerfandev@gmail.com · [LinkedIn](#) · [Github](#) · Montreal, QC

Summary

Technology professional with a track record of building and shipping at the intersection of AI, software engineering, and client enablement. At Botpress, I wore every hat: architecting end-to-end AI agents for Fortune 500 enterprise clients, contributing directly to the core product codebase, building internal tooling from scratch in React and TypeScript, and enabling client engineering teams through consulting, documentation, and training. I learn fast, figure things out independently, and thrive in fast-moving environments where the problems are ambiguous and the bar is high. Fluent in English, French, and Arabic.

Experience

Solutions Architect · Botpress · Mar 2025 – Present

Montreal, QC · AI startup, Series B hyper-growth — ~100 employees

Botpress is a fast-growing AI startup building an LLM-powered conversational AI platform that helps companies design, launch, and manage AI agents for support, sales, and internal workflows. Joining during its Series B hyper-growth phase meant operating with a startup mindset at every level — high ownership, no playbook, and the expectation that you figure things out. I wore multiple hats simultaneously: Solutions Architect for enterprise clients, internal software developer, technical consultant, documentation author, and product contributor — often within the same week.

Stack: TypeScript · JavaScript · React · Tailwind CSS · Node.js · Botpress ADK · Claude MCP · REST APIs · Webhooks

Enterprise AI Agent Architecture

- Architected and deployed end-to-end conversational AI agents for Teams and Enterprise clients, including Fortune 500 accounts, integrating LLMs, complex multi-step workflows, and custom guardrails into existing enterprise ecosystems.
- Designed the full agent architecture from scratch on each engagement: conversation flow, behavioral logic, tool integrations, API connections, prompt engineering, and error handling — all aligned to the client's specific business processes.
- Delivered agents capable of real-world autonomous execution: flight bookings, refund processing, cart management, live shipping lookups, data retrieval and processing — not chatbots, but AI systems that take action.
- Applied skills in conversation architecture, prompt engineering, RAG pipeline design, and LLM orchestration across dozens of client deployments.

Internal Tooling — Design & Engineering

- Built a **CSM Intelligence Dashboard** from scratch (React, TypeScript, Tailwind CSS, Botpress API, Claude MCP): gave Customer Success agents an at-a-glance view of client bot health — CSAT trends, AI spend, LLM execution counts, and message volumes — alongside an embedded AI assistant for live Q&A. Adopted by 2–3 CSM agents; estimated to save 3–6 hours per agent per week.
- Built a **Component Import Studio** — an App Store-style UI replacing a terminal-based CLI workflow (Botpress message CLI). Any employee could import custom message components with a single click and a bot ID, eliminating the need for CLI knowledge and streamlining team workflows significantly.
- Contributed directly to the **Botpress Cloud Studio** codebase: fixed UI and data-binding bugs, updated a message component to support multi-choice interactions, and shipped custom components used in production.

Technical Consulting & Client Strategy

- Acted as a trusted technical advisor to enterprise client stakeholders, translating business objectives into scalable AI implementation roadmaps.
- Provided structured recommendations on conversational AI best practices, LLM selection, workflow design, and platform architecture.

Client Enablement & Feedback Loops

- Closed 1,200+ customer support tickets; surfaced recurring patterns that generated actionable engineering feedback and informed product roadmap priorities.
- Part of the founding "Client 0" group for **Botpress Desk** (an AI-native ticketing system): provided structured UX feedback, feature recommendations, and pre-launch quality input that shaped the product before public release. Desk has since shipped.
- Authored public-facing architectural how-tos, internal employee reference guides, and bespoke technical documentation tailored to complex enterprise edge cases.
- Conducted high-impact 1-on-1 technical training sessions with client engineering teams to accelerate platform autonomy and reduce dependency on support.

Software Developer · 100Devs (Freelance) · Apr 2023 – Mar 2025

Remote

Engineered and delivered full-stack web applications for clients as part of a selective freelance developer network, owning projects from scoping through launch and ongoing maintenance.

Stack: JavaScript · React · React Router · Node.js · HTML5 · CSS3 · Tailwind CSS · MongoDB · Google Firebase · REST APIs · Git

- Built responsive, performant full-stack web applications end-to-end for clients, directly improving business operations and user engagement.
- Collaborated closely with clients to translate business requirements into technical scopes, then executed independently through design, development, and deployment.
- Launched and maintained high-traffic web applications; optimized for performance and reduced maintenance overhead through clean, well-structured code.
- Integrated third-party REST APIs and implemented authentication, real-time data, and cloud storage solutions (Firebase, MongoDB).
- Practiced whiteboard wireframing and user flow mapping as a first step on every project, grounding development in user-centred thinking before writing code.

- Applied version control best practices with Git throughout all projects, facilitating clean collaboration and release management.

Software Tester & Quality Assurance · TELUS · Mar 2022 – Jan 2024

Montreal, QC

Conducted rigorous QA across internal employee-facing software applications at one of Canada's largest telecommunications companies, ensuring functionality, usability, and performance standards were met before release.

- Designed and executed comprehensive test plans, test cases, and test scripts covering functional, regression, and usability testing across multiple application releases.
- Documented defects with precise reproduction steps, severity classifications, and supporting evidence; collaborated directly with developers on root cause analysis and resolution.
- Evaluated user interfaces and workflows end-to-end, providing structured recommendations to improve digital user experience — bridging QA and UX thinking.
- Identified and escalated systemic issues, contributing to process improvements and refining testing methodologies for increased coverage and efficiency.
- Maintained full test traceability and accountability through organized documentation throughout the development lifecycle.
- Kept current with industry testing trends and tools through ongoing professional development.

Technical Support Specialist · TELUS · Jan 2021 – Mar 2022

Montreal, QC

Delivered technical support for TELUS SmartHome Security — a connected hardware, software, and mobile platform — via phone, email, and chat.

- Diagnosed and resolved complex technical issues involving network connectivity, software configuration, device compatibility, and mobile app behaviour across the SmartHome Security ecosystem.
- Provided consultative, step-by-step guidance on system setup, device pairing, and ongoing maintenance — educating customers rather than just resolving tickets.
- Consistently met or exceeded performance benchmarks for response time, resolution time, and customer satisfaction ratings.
- Maintained detailed records of customer interactions, troubleshooting steps, and resolutions to support knowledge base development and quality audits.
- Collected and relayed structured product feedback and recurring issue patterns to internal teams, contributing to product improvement cycles.

Technical Skills

Category	Technologies & Tools
Languages	TypeScript, JavaScript, Python (basic), HTML5, CSS3
Frontend	React, React Router, Tailwind CSS, Next.js (learning)
Backend & APIs	Node.js, REST APIs, Webhooks, Google Firebase
Databases	MongoDB, Firebase Firestore
AI & LLM	Claude API, Claude MCP, Claude Code, Botpress ADK, prompt engineering, RAG, LLM orchestration, conversational AI architecture
Platforms	Botpress.cloud, Botpress Cloud Studio, Botpress Desk
Dev Tools	Git, GitHub, VS Code
Design	Figma (working knowledge), whiteboard wireframing, user flow mapping, conversation architecture
QA	Test planning, defect reporting, regression testing, root cause analysis

Education

Bachelor of Arts, Urban Studies/Affairs · Concordia University · Jan 2020 – Mar 2023

DEC, Communications & Social Sciences · Vanier College · Jan 2016 – Mar 2019
